Two in three Australians will be diagnosed with skin cancer by the age of 70.

The FDA approved drug **rapamycin makes mice live 60% longer**

and, in some studies, reduces the risk of cancer.

Topical rapamycin could reduce the risk of getting skin cancer, and **adding rapamycin to**

sunscreen could be an effective way to deliver it. Liposomal rapamycin is one possibility. It is possible this will also make skin look younger with repeated use.
